Technical description:

The MCS Electronic Analogue Throttle Controls have been developed to match the signal required to operate DDEC III, DDEC IV, DDEC V and DDEC VI. The signal generated by the pedal will allow a smooth and precise engine speed control.

The following information is dedicated to the **DDEC III, DDEC IV and DDEC V** Engine Management Systems. For your **DDEC VI** applications, please contact our factory. Technical information, product references and drawings are available upon request.

The **Hall Effect Sensor**, fitted on the Throttle Control has two separated galvanic output signals. Depending upon setting, the sensor can deliver one single analogue signal, two analogue signals, one analogue signal + PWM signal or one analogue signal + IVS (Idle Validation Switch), which can also be programmed as kick-down signal, if this option is required. The second signal is nevertheless not activated for applications when used on standard **DDEC III, DDEC IV and DDEC V** control units.

The output values of the two channels are **programmable** and hence can be adapted to the customer's specification

For **DDEC III, DDEC IV and DDEC V** Engine Management System, the sensor is factory preset with **one single analogue (0,5V-4,5V)** output signal. No IVS output is activated.

The MCS Electronic Analogue Throttle Control can be connected directly to the DDEC III, DDEC IV and DDEC V control unit

Optional wire harness according to customer specification (length and connector models) is available upon request.

Please don't hesitate to contact our factory if you need any assistance about your application.
